(PDF) Fatigue of Composite Materials

The fatigue behaviour of fibre-reinforced composite materials is complex and present knowledge is far from complete. Several classes of models attempt to predict the fatigue life and/or fatigue degradation of fibre-reinforced composites. Two major classes are the residual stiffness models and the residual strength models.

Composites Science and Technology - Journal - Elsevier

Fatigue limit stress is a key design parameter for the structure fatigue design of composite materials. In this paper, a micromechanical fatigue limit stress model of fiber-reinforced ceramic-matrix composites (CMCs) subjected to stochastic overloading stress is developed. The fatigue limit stress of different carbon fiber-reinforced silicon carbide (C/SiC) composites (i.e., unidirectional (UD ...

Fatigue phenomena occur when a material is subjected to cyclic loading, causing damage that can progress to failure. Both are critical factors in the long-term performance and reliability of materials such as polymer matrix composites, which are often exposed to these types of stress in engineering applications.

Creep and Fatigue in Polymer Matrix Composites (Woodhead ...

Yielding in materials science, fatigue is the weakening of a material caused by cyclic loading that results in progressive and localised structural damage and the growth of cracks. Once a fatigue crack has initiated, each loading cycle will grow the crack a small amount, typically producing striations on some parts of the fracture surface.
