A minimum flow bypass, or recirculation, line can be configured many ways. It could be as simple as a continuous bypass, where the requirements are only piping and an orifice. A more complex line could be set up to use a series of valves. Below is an illustration of a simple minimum flow bypass line. Meeting Minimum Flow Conditions

What Is a Centrifugal Pump Minimum Flow Bypass Line?

This variation is provided in Crane (1988) as a graph for hydrocarbon vapors and natural gases, and as an equation for other common gases. The impact of pressure is minor and the viscosity correction for pressure is less than 10% for the gases in our calculation for pressures up to 500 psi (34.5 bar) (Crane, 1988).

Because R is less than 2000, this flow is laminar. If the flow rate is tripled to 150,000 bbl/day, the Reynolds number becomes 3570 and the flow will be in the critical region. At flow rates above 168,040 bbl/day, the Reynolds number exceeds 4000 and the flow will be in the turbulent region. Thus, for this 16-in pipeline and given liquid viscosity of 250 cSt, flow will be fully
