In the past I've implemented an NES, SNES APU, HQ2X filter, etc in an FPGA so I figured full SNES was the next logical step. I've been making lots of progress and I wanted to share with you all the current state of the design. Hardware setup: - The entire SNES is hooked up to my TLA715 logic analyzer for investigation purposes.

A reimagining of perhaps the greatest video game system of all time. Engineered with an FPGA. No emulation. 1080p. Zero lag. Total accuracy. The Super Nt is not a plug n' play toy. It is the definitive way to explore Nintendo's 16-bit era. Compatible with the 2,200+ SNES and Super Famicom game cartridge library.

My goal with this project is to learn FPGA design by implementing an original Nintendo Entertainment System (North American, not the Famicom) in Verilog. I'm still working out details of implementation (A/V peripherals, memory, user interface, etc), but I have a few design choices already made (mostly purely arbitrarily).

With an FPGA, the actual hardware of the system is being reproduced internally. That might seem like a small distinction to make, but it's the reason that FPGAs have so much potential. In this case, that FPGA is a Spartan 6 that, with the help of a few other components, completely replicates the NES's hardware.

Decades ago, central processing units (CPUs) were implemented in discrete transistors and, later, in integrated-circuit logic devices. That all changed when the first microprocessor, Intel's 4-bit 4004, made its debut in 1971. For many years, products from Intel and its competitors were the only choice for engineers who wanted programmable processing power in their designs.
