An intrusion detection system (IDS) is a device, or software application that monitors a network or systems for malicious activity or policy violations. Any intrusion activity or violation is typically reported either to an administrator or collected centrally using a security information and event management (SIEM) system. A SIEM system combines outputs from multiple sources and uses alarm ...

### Intrusion detection system - Wikipedia

Network intrusion detection and response systems have come a long way over the years. As digital networks become more and more complex, however, such products can sometimes fall flat. For example, even though non-malware is an increasingly common attack vector, traditional network intrusion, detection, and response solutions struggle to uncover these attacks and still focus primarily on malware.
